```

CyberArk is an access management tool that enables developers to safely retrieve passwords from resource accounts secured in the safest place possible, CyberArk's Vault.

Empower your team by allowing each developer to have the necessary access at their disposal, improving their flexibility, and protecting your resources against any threat.

Empowering security

Who said that security limits users' capabilities? 😉

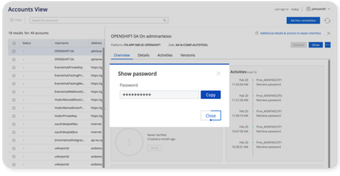

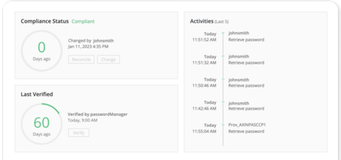

Customize individual access to resources

Privileged account customization allows specific permission degrees to attain role-oriented activities. Now everyone is invited to the game!

Retrieve passwords securely

CyberArk makes it possible to retain secrets locally, enabling a secure method to retrieve resource credentials without the risk of exposing them to other systems.

Intelligent controls for password management

CyberArk helps you see who is accessing your passwords, track the activity around them, and automate updating and checking them against compliance.
